~~1970~~
~~Amz letter?~~

Dear Dr. Colby:

I have compiled the enclosed bibliography from an extensive bibliography included in "Neoplasms of the Domesticated Mammals" by E. Cotchin - Commonwealth Bureau of Animal Health - Commonwealth Agricultural Bureau 1956 - I do not know how many of these articles ^{are going} will be available to us, and how many of these are going to be useful, but, I hope, there will be enough literature for our purpose.

A good bibliography ^{up to} 1962 is included in the "Handbuch der Speziellen Pathologischen Anatomie, 1962 (I will send you the exact reference) - An interesting table listing tumors by species and locations is included in the "Veterinary Pathology" by Smith & Jones (2nd. & Feibiger 1966)

In addition to the problem outlined in your letter, which would give the increase of lung cancer in a non smoking dog population I am trying to assemble literature which may give an answer to the question: In which way does cancer of "dogs" differ from cancer of "men" (type of cancer, sex, age occ.)

It would have interested me to go to the Institute für Strahlenforschung in Frankfurt, but I have to give that up - In my program, however, remains Homburg, where my husband has been invited for a lecture - I think that it would be very useful to visit Dr. Weber of the Verband der Zigaretten Industrie, I have already been in touch with him -

I am sending a few articles under separate covers

Best Greeting -

Sincerely,
A. S. Calverman
Prof.
